2. Feature Overview

This document defines the requirements for the mock sprint deliverable: a styled login page that leads into a team page. The feature is built on the existing shared development boilerplate and is intended to demonstrate the team's ability to run a full sprint cycle - from requirements to sign-off - before the real client project begins.

3. Purpose

To give the team a low-risk, self-contained feature to practice the full workflow (requirements → design → build → test → sign-off) using the same tools, board structure, and handoff process that will be used for the real FieldCapture project.

4. Scope

4.1. In-scope

- Restyle the existing login page so it looks intentional, readable, and responsive.
- Keep the existing email/password login form visible and usable.
- Redirect or lead the user to the team page according to the existing mock sprint flow.
- Build a team page showing each member's name, photo, role, and short blurb.
- Handle missing images and long text without breaking the layout.

4.2. Out-of-scope

- Changing authentication logic, password rules, backend auth, or session behavior.
- Building real FieldCapture inspection, incident reporting, offline sync, or dashboard features.
- Adding new user-management functionality beyond the boilerplate task requirement.

5. User Story

As a team member reviewing the mock sprint artifact, I want to log in and see a styled team page, so that the team can demonstrate a complete design, development, testing, and sign-off workflow.

6. Acceptance Criteria

- Login page has updated styling and does not look like unfinished boilerplate.
- Email and password fields remain visible, readable, and usable.
- Existing login validation/error behaviour remains visible after restyling.
- Login work is styling-only: no authentication logic or session behaviour is changed.
- Successful login or mock sprint flow leads to the team page.
- Team page displays each member's name, photo, role, and short blurb.
- Team page includes Kim Khanh Do, Kai Jie Yee, Pierre Tan, and Khanh Nguyen Hoang Quoc.
- Missing or broken photos use a placeholder/default image.
- Long names, roles, and blurbs wrap or truncate cleanly without overlap.
- Pages are readable and usable on desktop screen sizes.
-

7. Assumptions & Edge Cases

7.1. Assumptions

- The login page already exists in the boilerplate.
- The mock sprint team page may use static team content unless Dev safely wires another source.
- Final member photos and blurbs can be updated by each member before PM sign-off.
- Login can use hardcoded or mock credentials - no real backend auth is required.
- Desktop browser is the primary target; mobile responsiveness is a bonus, not a requirement.

7.2. Edge Cases

Edge Case	Expected Behaviour
Missing/broken photo	Show a placeholder/default image.
Long name/role/blurb	Wrap or truncate cleanly; no overlapping cards or text.
Login error	Keep existing error feedback visible after restyling.

8. Roles & Responsibilities

Role	Name	Responsibility
PM	Kim Khanh Do	Track Planner card completion, confirm checklist items, and sign off last.
BA	Kai Jie Yee	Define requirements, scope, acceptance criteria, validation/display rules, and edge cases. Share handoff with PM and UX.
UX	Khanh Nguyen Hoang Quoc	Design the login styling and team page layout against the BA requirements.
Dev 1	Pierre Tan	Build the team page and login-to-team-page flow according to the approved design and requirements.
Dev 2	Khanh Nguyen Hoang Quoc	Support Dev 1 on building the feature, and pick up additional build tasks as needed.
Dev Testing	Kai Jie Yee	Test the feature against acceptance criteria and report issues. Devs must not test their own code.

9. Sign-off

This feature is considered Done when every acceptance criterion is checked, the feature is deployed or linked, this BA requirements document is linked from the Planner card, testing has been completed by a non-author developer, and the PM has completed final sign-off.
